SGM803B/SGM809B/SGM810B Low Power Microprocessor Supervisory Circuit in 3-Pin SOT-23

GENERAL DESCRIPTION

The SGM803B/SGM809B/SGM810B supervisory circuits monitor the power supply voltage in microprocessor and digital systems. They provide a reset output during power-up, power-down and brownout conditions. On power-up, an internal timer holds reset asserted for 240ms. This holds the microprocessor in a reset state until conditions have stabilized. The nRESET output remains operational with V_{CC} as low as 1V. The SGM803B and SGM809B provide an active low reset signal (nRESET) while the SGM810B provides an active high signal (RESET) output. The SGM809B/SGM810B have push-pull outputs, whereas the SGM803B has an open-drain output, which requires an external pull-up resistor.

Five reset threshold voltage options are available, suitable for monitoring 3V, 3.3V and 5V supply voltages.

The reset comparator features built-in glitch immunity, making it immune to fast transients on V_{CC} .

The low supply current of typically 300nA makes the SGM803B/SGM809B/SGM810B ideal for use in portable, battery operated equipment. All are specified over the extended -40°C to +125°C temperature range.

FEATURES

- Precision Voltage Monitor: 3V, 3.3V and 5V Options
- Superior Upgrade for MAX803/MAX809/MAX810 and ADM803/ADM809/ADM810
- Fully Specified over Temperature
- VCC Transient Immunity
- Low Power Consumption: 300nA (TYP)
- Reset Assertion Down to 1V V_{cc}
- 150ms Power-On Reset (MIN)
 Open-Drain nRESET Output (SGM803B)
 Push-Pull nRESET Output (SGM809B)
 Push-Pull RESET Output (SGM810B)
- -40°C to +125°C Operating Temperature Range
- Small Packaging SGM803B Available in SOT-23-3 and SOT-23 SGM809B Available in SOT-23-3 and SOT-23 SGM810B Available in SOT-23-3 and SOT-23

APPLICATIONS

Low Power Microprocessor Supervisory Circuit in 3-Pin SOT-23

OVERSTRESS CAUTION

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

ESD SENSITIVITY CAUTION

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

DISCLAIMER

SG Micro Corp reserves the right to make any change in circuit design, or specifications without prior notice.

PIN CONFIGURATIONS

PIN DESCRIPTION

NAME	PIN NUMBER			FUNCTION			
INAME	SGM803B SGM809		SGM810B	I GIVE HON			
GND	1	1	1	Ground.			
nRESET	2	2		Active Low Reset (SGM803B/SGM809B). nRESET remains low while V_{CC} is below the reset threshold, and remains low for 240ms (TYP) after V_{CC} rises above the reset threshold.			
RESET	_	_	2	Active High Reset (SGM810B). RESET remains high while V_{CC} is below the reset threshold, and remains high for 240ms (TYP) after V_{CC} rises above the reset threshold.			
V _{CC}	3	3	3	Power Supply. Power supply voltage that is monitored.			

ELECTRICAL CHARACTERISTICS

(V_{CC} = 5V for M/J Models, 3.3V for T/S Models, 3V for R Model, unless otherwise noted.)

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS		
SUPPLY							
Voltage	T _A = +25°C	1		5.5	v		
Voltage	$T_{A} = -40^{\circ}C \text{ to } +125^{\circ}C$	1.25	1.25 5.5		v		
	V _{CC} < 5.5V, SGM8_M/J, T _A = +25°C		420	560	nA		
Queent	V_{CC} < 5.5V, SGM8_M/J, T_A = -40°C to +125°C			730

APPLICATION INFORMATION

Benefits of an Accurate Reset Threshold

In other microprocessor supervisory circuits, tolerances in supply voltages lead to an overall increase in reset tolerance levels due to the deterioration of the microprocessor reset circuit's power supply. The possibility of a malfunction during a power failure is greatly reduced because the SGM803B/SGM809B/ SGM810B series can operate effectively even when there are large degradations of the supply voltages. Another advantage of the SGM803B/SGM809B/ SGM810B series is its very accurate internal voltage reference circuit. These benefits combine to produce an exceptionally reliable voltage monitor circuit.

Interfacing to Microprocessors with Multiple Interrupts

In a number of cases, it is necessary to interface many interrupts from different devices (for example, thermal, altitude, and velocity sensors). The SGM803B/SGM809B/SGM810B can easily be integrated into existing interrupt-handling circuits, as shown in Figure 1, or can be used as a standalone device.

Figure 1. Interfacing to Microprocessors with Multiple Interrupts

Interfacing to Other Devices' Output

The SGM803B/SGM809B/SGM810B series is designed to integrate with as many devices as possible, therefore, has a standard output dependent on V_{CC} . This enables the parts to be used in both 3V and 5V, or any nominal voltage within the minimum and maximum specifications for V_{CC} . This design simplifies interfacing this device to other devices.

Ensuring a Valid Reset Output Down to V_{CC} = 0V

When V_{CC} falls below 1V, the SGM803B/SGM809B nRESET no longer sinks current. A high impedance CMOS logic input connected to nRESET may, therefore, drift to undetermined logic levels. To eliminate this problem, a 100k Ω resistor should be connected from nRESET to ground.

Figure 2. Ensuring a Valid Reset Output Down to Vcc = 0V

Preventing the High Voltage Spike

To prevent the high voltage spike damage or to limit input V_{CC} current, it is recommended to connect a resistor R1 (0 Ω to 1k Ω) in series to V_{CC}, and one capacitor C1 (0.1 μ F to 4.7 μ F) should be connected between V_{CC} pin and GND. The schematic is shown in Figure 3. It must be noted that, the input resistor will affect output driving capability.

Figure 3. Preventing the High Voltage Spike

SGM803B/SGM809B/SGM810B

DETAILED DESCRIPTIONS

Reset Timing

The reset signal is asserted low for the SGM809B and high for the SGM810B when the power supply voltage falls below the threshold trip voltage and remains asserted for at least 150ms after the power supply voltage has risen above the threshold.

NOTE *: Undefined below minimum operating voltage.
