Precision Picoampere Input Current Quad Operational Amplifier

OP497

FEATURES

Low offset voltage: 75 µV maximum Low offset voltage drift: 1.0 µV/°C maximum Very low bias current 25°C: 150 pA maximum -40°C to +85°C: 300 pA maximum Very high open-loop gain: 2000 V/mV minimum Low supply current (per amplifier): 625 µA maximum Operates from ±2 V to ±20 V supplies High common-mode rejection: 114 dB minimum

APPLICATIONS

Strain gage and bridge amplifiers High stability thermocouple amplifiers Instrumentation amplifiers Photocurrent monitors High gain linearity amplifiers Long-term integrators/filters Sample-and-hold amplifiers Peak detectors Logarithmic amplifiers Battery-powered systems

GENERAL DESCRIPTION

The OP497 is a quad op amp with precision performance in the space-saving, industry standard 16-lead SOIC package. Its combination of exceptional precision with low power and extremely low input bias current makes the quad OP497 useful in a wide variety of applications.

Precision performance of the OP497 includes very low offset (<50 μ V) and low drift (<0.5 μ V/°C). Open-loop gain exceeds 2000 V/mV ensuring high linearity in every application. Errors due to common-mode signals are eliminated by its common-mode rejection of >120 dB. The OP497 has a power supply rejection of >120 dB which minimizes offset voltage changes experienced in battery-powered systems. The supply current of the OP497 is <625 μ A per amplifier, and it can operate with supply voltages as low as ±2 V.

The OP497 uses a superbeta input stage with bias current cancellation to maintain picoamp bias currents at all temperatures. This is in contrast to FET input op amps whose bias currents start in the picoamp range at 25°C but double for every 10°C rise in temperature to reach the nanoamp range above 85°C. The input bias current of the OP497 is <100 pA at 25°C.

Rev. E

Information furnished by Analog Devices is believed to be accurate and reliable. However, no responsibility is assumed by Analog Devices for its use, nor for any infringements of patents or other rights of third parties that may result from its use. Specifications subject to change without notice. No license is granted by implication or otherwise under any patent or patent rights of Analog Devices. Trademarks and registered trademarks are the property of their respective owners.

Combining precision, low power, and low bias current, the OP497 is ideal for a number of applications, including instrumentation amplifiers, log amplifiers, photodiode preamplifiers, and long-term integrators. For a single device, see the OP97 data sheet, and for a dual device, see the OP297 data sheet.

ABSOLUTE MAXIMUM RATINGS

Absolute maximum ratings apply to packaged parts.

Table 2.

Parameter	Rating
Supply Voltage	±20 V
Input Voltage ¹	20 V
Differential Input Voltage ¹	40 V
Output Short-Circuit Duration	Indefinite
Storage Temperature Range	–65°C to +150°C
Operating Temperature Range	–40°C to +85°C
Junction Temperature Range	–65°C to +150°C
Lead Temperature (Soldering, 60 sec)	300°C

 $^1\mbox{For supply voltages less than }\pm 20\mbox{ V}, the absolute maximum input voltage is equal to the supply voltage.$

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

THERMAL RESISTANCE

 θ_{JA} is specified for the worst-case mounting conditions, that is, θ_{JA} is specified for a device in socket for the PDIP package, and θ_{JA} is specified for a device soldered to the printed circuit board (PCB) for the SOIC package.

Table 3.

Package Type	θ _{JA}	οιθ	Unit
14-Lead PDIP (N-14)	76	33	°C/W
16-Lead SOIC (RW-16)	92	23	°C/W

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

APPLICATIONS INFORMATION

Extremely low bias current makes the OP497 attractive for use in sample-and-hold amplifiers, peak detectors, and log amplifiers that must operate over a wide temperature range. Balancing input resistances is not necessary with the OP497. High source resistance, even when unbalanced, only minimally degrades the offset voltage and TCV_{os}.

The input pins of the OP497 are protected against large differential voltage by back-to-back diodes and current-limiting resistors. Common-mode voltages at the inputs are not restricted and may vary over the full range of the supply voltages used.

The OP497 requires very little operating headroom about the supply rails and is specified for operation with supplies as low as ± 2 V. Typically, the common-mode range extends to within 1 V of either rail. When using a 10 k Ω load, the output typically swings to within 1 V of the rails.

AC PERFORMANCE

The ac characteristics of the OP497 are highly stable over its full operating temperature range. Figure 30 shows the unity-gain small signal response. Extremely tolerant of capacitive loading on the output, the OP497 displays excellent response even with 1000 pF loads (see Figure 31).

Figure 33. Simplified Schematic Showing One Amplifier

GUARDING AND SHIELDING

To maintain the extremely high input impedances of the OP497, care must be taken in circuit board layout and manufacturing. Board surfaces must be kept scrupulously clean and free of moisture. Conformal coating is recommended to provide a humidity barrier. Even a clean PCB can have 100 pA of leakage currents between adjacent traces; therefore, use guard rings around the inputs. Guard traces are operated at a voltage close to that on the inputs, as shown in Figure 34, so that leakage currents become minimal. In noninverting applications, connect the guard ring to the common-mode voltage at the inverting input. In inverting applications, both inputs remain at ground; therefore, the guard trace should be grounded. Place guard traces on both sides of the circuit board.

Figure 34. Guard Ring Layout and Connections

OPEN-LOOP GAIN LINEARITY

The OP497 has both an extremely high gain of 2000 V/mV typical and constant gain linearity. This enhances the precision of the OP497 and provides for very high accuracy in high closed-loop gain applications. Figure 35 illustrates the typical open-loop gain linearity of the OP497.

APPLICATIONS CIRCUIT PRECISION ABSOLUTE VALUE AMPLIFIER

The circuit in Figure 36 is a precision absolute value amplifier with an input impedance of 30 M Ω . The high gain and low TCV_{0S} of the OP497 ensure accurate operation with microvolt input signals. In this circuit, the input always appears as a common-mode signal to the op amps. The CMR of the OP497 exceeds 120 dB, yielding an error of less than 2 ppm.

Figure 36. Precision Absolute Value Amplifier

PRECISION CURRENT PUMP

Maximum output current of the precision current pump shown in Figure 37 is ± 10 mA. Voltage compliance is ± 10 V with ± 15 V supplies. Output impedance of the current transmitter exceeds 3 M Ω with linearity better than 16 bits.

Figure 37. Precision Current Pump

PRECISION POSITIVE PEAK DETECTOR

In Figure 38, the C_H must be of polystyrene, Teflon^{*}, or polyethylene to minimize dielectric absorption and leakage. The droop rate is determined by the size of C_H and the bias current of the OP497.

Figure 38. Precision Positive Peak Detector

SIMPLE BRIDGE CONDITIONING AMPLIFIER

Figure 39 shows a simple bridge conditioning amplifier using the OP497. The transfer function is

$$V_{OUT} = V_{REF} \left(\frac{\Delta R}{R + \Delta R} \right) \frac{R_F}{R}$$

The REF43 provides an accurate and stable reference voltage for the bridge. To maintain the highest circuit accuracy, R_F should be 0.1% or better with a low temperature coefficient.

Figure 39. Simple Bridge Conditioning Amplifier Using the OP497

NONLINEAR CIRCUITS

Due to its low input bias currents, the OP497 is an ideal log amplifier in nonlinear circuits, such as the squaring amplifier and square root amplifier circuits shown in Figure 40 and Figure 41. Using the squaring amplifier circuit in Figure 40 as an example, the analysis begins by writing a voltage loop equation across Transistors Q1, Q2, Q3, and Q4.

$$V_{TI}In\left(\frac{I_{IN}}{I_{SI}}\right) + V_{T2}In\left(\frac{I_{IN}}{I_{S2}}\right) = V_{T3}In\left(I\frac{I_O}{I_{S3}}\right) + V_{T4}In\left(\frac{I_{REF}}{I_{S4}}\right)$$

All the transistors in the MAT04 are precisely matched and at the same temperature; therefore, the I_S and V_T terms cancel, giving

$$2InI_{IN} = InI_O + InI_{REF} = In (I_O \times I_{REF})$$

Exponentiating both sides of the thick equation lead to

$$I_O = \frac{(I_{IN})^2}{I_{REF}}$$

 $V_{OUT} = \left(\frac{R2}{I_{REF}}\right) \left(\frac{V_{IN}}{R1}\right)^2$

Op amp A2 forms a current-to-voltage converter which results in $V_{OUT} = R2 \times I_O$. Substituting ($V_{IN}/R1$) for I_{IN} and the previous equation for I_O yields

00309-041

A similar analysis made for the square root amplifier circuit in Figure 41 leads to its transfer function

$$V_{OUT} = R2\sqrt{\frac{(V_{IN})(I_{REF})}{R1}}$$

In these circuits, I_{REF} is a function of the negative power supply. To maintain accuracy, the negative supply should be well regulated. For applications where very high accuracy is required, a voltage reference can be used to set I_{REF} . An important consideration for the squaring circuit is that a sufficiently large input voltage can force the output beyond the operating range of the output op amp. Resistor R4 can be changed to scale I_{REF} , or R1 and R2 can be varied to keep the output voltage within the usable range.

Figure 41. Square Root Amplifier

Unadjusted accuracy of the square root circuit is better than 0.1% over an input voltage range of 100 mV to 10 V. For a similar input voltage range, the accuracy of the squaring circuit is better than 0.5%.

Figure 40. Squaring Amplifier
