

Programmable High Current Overvoltage Protection Switch

General Description

SY6884 is a programmable over voltage protection switch with 5A current capability to prevent damage to the downstream system with low voltage rating. It achieves wide input voltage range from 2.5V_{DC} to 25V_{DC}. Extremely low power path on resistance R_{PWPT} helps to reduce power loss during the normal operation. It integrates the over-temperature protection and auto-recovery with hysteresis to protect against over current events. This IC along with small CSP (0.89mm×1.43mm) footprint provides small PCB area application.

Ordering Number	Package Type	Note
SY6884PYC	CSP0.89×1.43-6	

Features

- V_{IN}=2.5V to 25V, Absolute Maximum V_{IN}=28V
- Extremely Low Power Path on Resistance R_{PWPT}: 30mΩ Typ.
- Fast OVP Response Time: 100 ns.
- Auto-enabled Switch with 15ms Debounce Time
- Programmable Over Voltage Threshold From +4V to +20V
- Internal Soft-start to Prevent Inrush Current
- Thermal Shutdown Protection & Auto Recovery
- Short Circuit Protection
- Compact Package: CSP 0.89×1.43-6

Applications

- Smart Phone
- Tablet PCs
- Mobile Device

Pin Name	Pin Number	Pin Description
IN	A2, B2	Power input pin. Connect IN pins together. Decouple high frequency noise by connecting at least a 0.1μF MLCC to ground.
OUT	A1, B1	Output voltage pin. Source side of the internal FET. Connect OUT pins together for normal operation.
OVLO	C2	External OVLO program pin. Connect resistor divider to this pin to program the OVLO threshold. Make sure V_{OVLO} is higher than external OVLO select threshold 0.28V; otherwise the internal default OVP threshold 6.75V (typ.) is active. Pull down this pin to ground to disable external program function.
GND	C1	Power ground pin.

Note 1: Stresses beyond the “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: θ_{JA} is measured in the natural convection at $T_A = 25^\circ C$ on a Silergy’s test board.

Note 3: The device is not guaranteed to function outside its operating conditions.

Note 4: $R1=1M\Omega$ is a good starting value for minimum current consumption. Since V_{IN_OVLO} , V_{OVLO_TH} , and $R1$ are known, $R2$ can be calculated from the following formula:

$$V_{IN_OVLO}=V_{OVLO_TH} \times (1+R1/R2) = 1.2V \times (1+R1/R2)$$
