

### GENERAL DESCRIPTION

The SGM65231 is a high bandwidth bus switch with a low and flat on-resistance ( $R_{ON}$ ). The low and flat on-resistance allows for minimal propagation delay and supports rail-to-rail switching on the data input/output (I/O) ports. The device also features low data I/O capacitance to minimize capacitive loading and signal distortion on the data bus. Specifically designed to support high bandwidth applications, the SGM65231 provides an optimized interface solution ideally suited for broadband communications, networking and data-intensive computing systems.

The SGM65231 is organized as an 8-bit bus switch with a single output-enable ( $\overline{OE}$ ) input. When  $\overline{OE}$  is low, the bus switch is ON and the A port is connected to the B port, allowing bidirectional data flow between ports. When  $\overline{OE}$  is high, the bus switch is OFF and a high impedance state exists between the A and B ports.

This device is fully specified for partial-power-down applications using  $I_{OFF}$ . The  $I_{OFF}$  circuitry prevents damaging current backflow through the device when it is powered down. The device has isolation during power off.

To ensure the high impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pull-up resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

The SGM65231 is available in Green TQFN-4.5×3.5-20L and TSSOP-20 packages. It operates over an operating temperature range of -40°C to +125°C.

### FEATURES

- High Bandwidth Data Path (up to 500MHz)
- 5V Tolerant I/Os with Device Powered Up or Powered Down
- Low and Flat On-Resistance ( $R_{ON}$ ) Characteristics Over Operating Range: 4.5Ω (TYP)
- Rail-to-Rail Switching on Data I/O Ports
  - ♦ 0V to 5V Switching with 3.3V  $V_{CC}$
  - ♦ 0V to 3.3V Switching with 2.5V  $V_{CC}$
- Bidirectional Data Flow
- Low Input/Output Capacitance Minimizes Loading and Signal Distortion
- Data and Control Inputs Provide Undershoot Clamp Diodes
- Low Power Consumption:  $I_{CC} = 0.5mA$  (TYP)
- $V_{CC}$  Operating Range from 2.3V to 3.6V
- Data I/Os Support 0V to 5V Signaling Levels: (0.8V, 1.2V, 1.5V, 1.8V, 2.5V, 3.3V, 5V)
- Control Input Can Be Driven by TTL or 5V/3.3V CMOS Outputs
- $I_{OFF}$  Supports Partial-Power-Down Mode Operation
- Available in Green TQFN-4.5×3.5-20L and TSSOP-20 Packages

### APPLICATIONS

PCI Interface  
Differential Signal Interface  
Memory Interleaving, Bus Isolation  
Low Distortion Signal Gating

- $V_I$  and  $V_O$  are used to denote specific conditions for  $V_{I/O}$ .

**OVERSTRESS CAUTION**

Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.

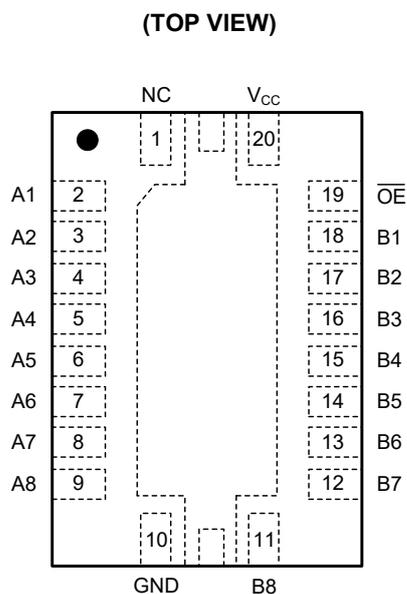

**ESD SENSITIVITY CAUTION**

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

## NOTES:

- $V_{IN}$  and  $I_{IN}$  refer to control input.  $V_I$ ,  $V_O$ ,  $I_I$  and  $I_O$  refer to data pins.
- For I/O ports, the parameter  $I_{OZ}$  includes the input leakage current.
- This is the increase in supply current for each input that is at the specified TTL voltage level, rather than  $V_{CC}$  or GND.
- This parameter specifies the dynamic power supply current associated with the operating frequency of a single control input.
- Measured by the voltage drop between the A and B terminals at the indicated current through the switch. On-resistance is determined by the lower of the voltages of the two (A or B) terminals.
- Typical values are at  $V_{CC} = 2.5V$ .
